The electronic apparatus recited in applicant's amended claim 1, for example, serves as a mobile station and is configured to detect a position of the electronic apparatus and a direction of movement of the electronic apparatus and retrieve the optimum base station from

the database of the electronic apparatus. The electronic apparatus works at high speed such that it can perform a high speed roaming process.

It is important to note that not only is the current position of the electronic apparatus determined but also the direction of movement of the electronic apparatus is taken into consideration. Thus, the electronic apparatus can perform a high speed retrieval of the optimum base station targeted for roaming.

None of the references disclosed these above-discussed limitations which are present in each of applicant's independent claims 1 and 8.

Applicant's dependent claims are deemed to be patentable by virtue of their dependency on independent claims 1 and 8.
